ABSTRACT

Property Finder is a DSA-based real estate search project designed to help users quickly find suitable properties from a large set of listings. Users can search based on details such as **location, price range, property type, and amenities**, making the property-selection process simpler and faster.

What makes this project unique is that it does not focus only on displaying property data. It demonstrates how different **string-matching algorithms**, such as Naive Pattern Matching, KMP, Rabin-Karp, Boyer-Moore, Z Algorithm, and Aho-Corasick, can be applied to real-estate searches. These algorithms are part of the DSA-3 syllabus.

The project will be developed using **Java in Visual Studio Code**. Users will enter their search requirements through the terminal, and the program will process the property data using the selected algorithm and display the matching properties directly in the **terminal output**.
